

top.lign professional

**Tooth-colored cold-curing polymer
for temporary and permanent restorations**

bredent

What are the distinctive features of top.lign professional?

temporary & permanent

- Approved for use for temporary and permanent restorations
- Certified class II a medical device

resistant to fracture & physiological

- Exceptional mechanical values (flexural strength: approx. 100 Mpa, E-modulus: approx. 2600 Mpa) enable the perfect combination of required stability of a denture and physiological elasticity
- Twice the flexural strength of bridge restorations (compared to other standard temporary polymers)
- Particularly suitable for implant-supported restorations

resistant to discoloration & plaque-resistant

- The compact structure of the material enables high-gloss polishing and prevents plaque accumulation
- Reduced water absorption, no yellowing and no discoloration thanks to full cross-linking of the material

superior polishability & edge stability

- Excellent polishing properties enable particularly fast and simple processing
- Optimized millability thanks to high edge stability

esthetic

- Perfect esthetic design options provided by the multi-layer full set the classic A-D shades
- Even monolithic restorations exhibit a very natural appearance thanks to the molecular structure and the use of luminescent shades
- Esthetic individualization is possible with the crea.lign® veneering composite (system of perfectly matched shades)

reliable & efficient

- Results without any bubbles
- Precision-fit results
- Gap-free bonding to veneers and denture teeth without additional chemical bonding

Indications

Temporary & interim restorations

Immediate-loading bridges on implants or natural teeth
also for long-term temporaries (period of wearing > 6 months)

- Fixed and partly removable
- With and without veneers
- With and without framework support

Implant-supported immediate-loading bridge

Immediate-loading bridge, monolithic, made of top.lign professional
